BUDAGOVSKIY, A. I.

Tachygraphic curves and their applicability in calculating river floods.  
Met. i girdrol., No 5, 1949.

3858. Budagovskiy, A. I. M. The permeation of water into the soil (in Russian), Moscow, Akad. Nauk SSSR, 137 pp. + illus. 1955; Ref. Zb. Met., 1956, Rev. 4394.

A brief analysis is made of the permeation of water into the soil, based on the results of laboratory and field tests made by author and other research workers. The relationship between intensity of permeation, and the humidity and temperature of the soil is examined. It is found that the initial degree of humidity very materially influences the intensity of permeation, particularly in heavy soils; with increasing initial wetting of the soil, the intensity of permeation decreases, as well as the coefficient of filtration. With decreasing temperature, the viscosity of the water changes, causing a further decrease in the coefficient of filtration. The influence of change in the surface tension of the water is in this case, however, insignificant.

Consideration is given separately to the influence of inhomogeneity of the soil on free and pressure infiltration. In the upper stratum of the soil, the value of the coefficient of filtration is governed by the intensity of the rainfall. Farther down, free infiltration is replaced by pressure infiltration. In the latter case, the intensity of permeation is determined, as in the case of a homogeneously deposited soil, by the Darcy equation, the only difference being that the relevant parameters become variable.

K  
2

Budagovsky, A.I.M.

depending on the location of the percolation front. The last  
method is based on the use of a special apparatus for  
investigation of the water-permeability of a soil by layers, which  
permits determination of the filtration coefficient and the other  
values necessary for drawing the percolation curve for infiltration  
under pressure.

It is noticeable that no recent foreign work on this subject is  
referred to.

SOV/124-57-7-8042

Translation from: Referativnyy zhurnal. Mekhanika, 1957, Nr 7, p 87 (USSR)

AUTHOR: Budagovskiy, A. I.

TITLE: The Dependence of Evaporation on Meteorological Conditions and on the Moisture Content of the Soil (Zavisimost' ispareniya ot meteologicheskikh usloviy i vlaghnosti pochvy)

PERIODICAL: Tr. Aralo-Kaspiysk. kompleksnoy ekspeditsii AN SSSR, 1956, Nr 6, pp 158-193

ABSTRACT: In the first part of this paper the author investigates the meteorological conditions most conducive to the evaporation of water from the soil. For this purpose he elects to examine the nearly "perfect" example thereof afforded by evaporation from soil containing an excess of moisture (the initial stage of evaporation). The evaporation is assumed to be represented by a residual term in the heat-balance equation, the turbulent-heat-flux term in that equation having been determined from the Monin formula (RZhMekh, 1954, abstract 3389; 1956, abstract 2277). Analysis showed that the diurnal sums of evaporation  $E_0$  from soil containing excess moisture are linked to the mean diurnal moisture deficit through the simple relationship

Card 1/4

SOV/124-57-7-8042

The Dependence of Evaporation on Meteorological Conditions and on the (cont.)

$$E_0 = \alpha d \quad (8)$$

which relationship became even more pronounced when stated in terms of five-day sliding averages. The coefficient of proportionality<sup>9</sup> as envisaged by the author in formula (8) conflicts with the usual conceptions thereof by depicting it as independent of the wind velocity. Nevertheless, the factor of wind velocity does affect the evaporation, but its effect thereon is allowed for in the term  $d$ . The author gives his interpretation of this result of his analysis of the observational data. The second part of the paper is devoted to an account of the laws governing the water motion inside the soil during the evaporation process, knowledge of which is considered a prerequisite of investigation of the second stage of evaporation, i. e., evaporation from moisture-deficient soil. In this part of the paper the author's analysis is based mainly on data drawn from the literature. He examines the three ways in which the soil acquires moisture, examining also in the case of each the motion of the capillary water, the motion of the "suspended" water, and the motion of the "suspended" water that is fixed along the capillary wall. It is shown that the speed at which the "suspended" water moves within the soil's surface layer is linked to the soil's moisture content  $W$  through the linear relationship

Card 2/4

SOV/124-57-7-8042

The Dependence of Evaporation on Meteorological Conditions and on the (cont.)

$$q_0 = a(W - W_r), \quad (29)$$

wherein  $a$  is a parameter and  $W_r$  the so-called "moisture content corresponding to capillary rupture". Here, the decrease in soil moisture over a time period  $T$  is described by the exponential law

$$W - W_r = (W_n - W_r) \exp(-aT/y_0),$$

wherein  $y_0$  is the thickness of the moisture-permeated soil layer,  $W$  is its initial moisture content [this should read  $W_n$ ; Transl. Ed. Note], and the evaporation  $E$  is linked to the soil's initial moisture content  $W$  by the formula

$$E = b(W - W_0)E_0. \quad (32)$$

In this latter expression  $E_0$ , taken from expression (8), is the evaporation from soil having an excess of moisture (which is to say that  $E_0$  is the soil's evaporative capacity),  $b$  is a nondimensional parameter, and  $W_0$  is the soil moisture level at which a water deficiency causes plants to start to wilt. The relationships obtained  
Card 3/4

SOV/124-57-7-8042

The Dependence of Evaporation on Meteorological Conditions and on the (cont.)

in this paper on the basis of analysis of observational data had been proposed previously, on a purely theoretical basis, by M. I. Budyko [ V sb.: Voprosy gidrometeorologicheskoy effektivnosti polezashchitnogo lesorazvedeniya (On the Hydro-meteorological Effectiveness of Afforestation as a Means of Soil Conservation). Gidrometizdat, 1950]. Expression (32) is suitable for describing the second stage of evaporation, the stage at which  $W < W_k$  (wherein the "critical" moisture content  $W_k$  is defined by the stipulation that the evaporative capacity  $E_0$  must equal the water's speed of motion  $q_0$ ). The author examines also, in the third part of the paper, the patterns of variation of the soil's moisture reserves and the patterns discernible in the gross evaporation over given periods of time. The corresponding relationships which the author arrives at are the result of an approximate integration of the equations already cited. Bibliography: 32 references.

TITLE:

Some Problems and Methods of Study of the Thermal and Water Conditions of Agricultural Fields (Nekotoryye zadachi i metody izucheniya vodnogo i teplovogo rezhimov sel'skokhozyaystvennykh poley)

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya geograficheskaya, 1958, Nr 6, p 26-37 (USSR)

ABSTRACT:

The right amount of heat and humidity is one of the most important conditions for the growth and development of plants, and the study of the water-thermal conditions of agricultural areas during the growing season is of great scientific and practical importance. In connection with such a study, the author singles out three most important problems: 1) the correlation of the indicators of water-thermal conditions with the state of plants and crops;

Card 1/2

SOV/10-58-6-3/21

Some Problems and Methods of Study of the Thermal and Water  
Conditions of Agricultural Fields

2) the water consumption of plants, and 3)  
the study of processes conditioning the changes  
in humidity of the soil during the growing sea-  
son. The author proposes an analytical solu-  
tion for these problems. The elaboration of  
21 equations is described in detail. There  
are 15 Soviet references.

Vsesoyuznyy hidrologicheskiy sbyt, 3rd, Leningrad, 1957.  
Trudy... t. III. Sessiya Ekspertiz (Transactions of the 3rd All-Union Hydrological Conference, v. 3). Hydrophysics Section). 470 p. Errata slip inserted.

Leningrad, Gidrogeotekhnika, 1959.

2,000 copies printed.

Sponsoring agency: Ol'more upravleniye gidrometeorologicheskoy sluzhby pri Sovete Ministerov RSFSR.

Resp. Ed.: V. I. Uryashev; Ed.: V. S. Protopopov; Tech. Ed.: N.I. Bravina.

PURPOSE: This work is intended for meteorologists, hydrologists, and hydrophysicists particularly those engaged in the study of snow and ice and evaporation processes.

CONTENTS: This book contains papers on hydrophysics which were presented and discussed at the Third All-Union Hydrological Conference in Leningrad, October 1957. The Conference published 10 volumes on various aspects of hydrology or which this is number 3. The editorial board in charge of the series include: V.A. Ur'yazev (Chairman), O.A. Alekin, Ye.V. Bliznashko (deceased), O.M. Borodov, M.A. Domantsev, G.P. Kalinin, G.P. Malinin, G.S. Kritskiy, B.I. Kudelin, L.P. Manoil, N.P. Matveev, A.A. Ponomarev, I.V. Popov, A.K. Proskurakov, D.I. Sosolovskiy, O.A. Spender, A.I. Chebotarev, and S.K. Cherkavskiy. This volume is divided into 2 sections: the first contains reports from the subsections for the study of evaporation processes, and the second contains reports from the snow and ice subsection. References accompany each article.

PURPOSE: This publication is intended for geophysicists, geographers, climato-  
logists, agronomists, and agriculturists.

CONTENTS: The seventeen articles contained in this publication represent con-  
demned versions of reports presented at the Conference on the Heat and Water  
Balance of the Earth's Surface, convened by the Glavnaya gidrometeorologicheskaya  
observatoriya in A. I. Vopyskov (Main Geophysical Observatory Izmail).  
A. I. Vopyskov) in April 1953. Individual articles deal with the investi-  
gation of the thermal balance of the earth's surface, problems of the ex-  
change of heat and moisture between the indicators of heat and  
of climate related to heat and moisture exchange, the indicators of heat and  
water balance in agriculture, and problems related to the effect of hydro-  
meteorological factors upon crop yields. Geographical processes and phenomena.  
No personalities are mentioned. References follow individual articles.

TITLE: Equipment of an Oxygen-Aerosol Ward in Garrison Hospitals (Oborudovaniye kislorodno-aerosol'noy palaty v garnizonnom gospitale)

PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 1, pp 85 - 87  
(USSR)

ABSTRACT: The author describes an oxygen-aerosol installation for wards of garrison hospitals. An aviation KP-18-type oxygen device is used for the economical consumption of oxygen and, if necessary, for the application of a mixture of oxygen and air by the continuous method to relieve labored breathing and unconsciousness. Combined oxygen and aerosol is

Abstract: A study was made of the peculiarities of growth, fruit-bearing and development of the most prevalent stocks of the dwarf group in production, the paradise 8 and 9, of the semi-dwarf group, dusen 2,3,4, and 5. Paradise apple plants form small bushes with manifold stems; in the fourth year of growth the plants attained a height of 90-100 cm and by the tenth year not more than 150 cm. The

Card : 1/2

Abs Jour: Ref Zhur-Biologiya, No 5, 1958, 2048.

dusens grow larger; by the fourth year of growth they were 152-205 cm (dusen 3 and 2); by the ninth to tenth years the dusen 3 was 221 cm in height and the dusen 2 was 308 cm. The paradises bear fruit extraordinarily rapidly, sometimes in the first year layers about a year after planting. Trees engrafted with dusen begin to bear fruit later than with paradises, although earlier than with wild apples. The dwarf and semi-dwarf stocks for productive purposes reproduce only by vegetative means. Systematic self rejuvenation of the bushes through shoots calls for the slow aging of dwarf stock with vegetative reproduction.

Title : On the Origin of the Dwarf Stock of Apple Tree.

Orig Pub : Botan. zh., 1957, No 2, 211-229

Abstract : Pallas's and Koch's hypotheses that the dwarf apple trees originated in the Volga River Area have not been confirmed since the contemporary researchers did not discover any Paradise, Dusen or other related forms in this region. The dwarf stock is not distributed widely in the Volga Area because of its poor winter resistance. On the basis of studies and observations of the dwarf forms of apple trees during 18 years under stationary conditions in the city of Michurin, and on the basis of surveys of wild and cultivated plants in Azerbaydzhan, Armenia, Georgia and Dagestan, - the author joins in the opinion

Card 1/2

- USSR/Cultivated Plants - Fruits. Berries.

Abs Jour : Ref Zhur Biol., No 12, 1958, 53788

that Paradise and Dusen belong to the genus *Malus pumila* Mill. which grows wildly and also is cultivated in the Caucasus and in Central Asia. On the basis of the materials obtained by an expedition of Soviet scientists in Iranian Azerbaydzhan and in Mazaideran, the author demonstrates that the dwarf apple tree grows in Iran also. The works of a number of authors prove the presence of wild and cultivated dwarf apple trees in Central Asia. The article gives a description of the biological and morphological peculiarities of different species of the dwarf apple tree. They do not differ from the Paradise of type VII and IX. A description of the Dusen types II, III and V is also given. A guide to the history of the propagation of the dwarf stock is included in the article.

TITLE: Measurement of the Complex Reflection Factor of Dielectric  
Material  $\gamma$

PERIODICAL: Izmeritel'naya tekhnika, 1960, No. 9, pp. 51-53

TEXT: The so-called free-space measuring method is used more and more for measuring the electromagnetic parameters of various materials. Here, it is recommended for measuring the complex reflection factor of the workpiece; the simple formulas from the paper (Ref. 7) should be used for calculating the electromagnetic parameters of the workpiece. An instrument for measuring the complex reflection factor of a plane-parallel sheet metal in the free space is described, and shown in Fig. 1. The instrument is a system of lines for transmitting the surface wave, and consists of a directional coupler (Ref. 9), a balancing device, and a phase shifter. The balancing device compares the controlled reference signal with the unknown signal reflected from the sample measured. The modulus of the reflection factor of the sample is determined from the angle of inclination of the threads of

Card 1/2 X

83529

Measurement of the Complex Reflection Factor      S/115/60/000/009/009/011  
of Dielectric Material      B012/B054

the standard reflector whereas the phase is determined from the indication on the rough and fine scale of the phase shifter. Fig. 2 shows a variant of the instrument described. This variant uses a controllable balancing device for balancing the amplitudes of the reference signal and of the signal measured. Here, the modulus of the reflection factor is determined from the angle of inclination of the dielectric waveguide section of the balancing device whereas the phase is determined in the same way as with the first instrument. It is pointed out that the most progressive optical measuring methods are used with the instruments described. Two causes of the high accuracy of measurement of the instruments are mentioned: 1) The standard reflector in the first, and the controllable balancing device in the second instrument make it possible to balance with high accuracy the amplitudes and phases of the reference signal and of the signal measured by means of successive tunings. 2) The interaction between the instrument antenna and the sample, which otherwise leads to errors, is very low in these instruments, which makes it unnecessary to use the more complicated measuring method required in other cases. There are 2 figures and 11 references: 8 Soviet.

TITLE: Application of asymptotic methods of nonlinear oscillation theory to the wave propagation problem

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 1, 1966, 93-101

TOPIC TAGS: wave propagation, wave equation

ABSTRACT: The solution of the wave propagation problem in a heterogeneous medium is achieved on the basis of the equation for a partial wave in a total field. After substituting A(x) (amplitude factor of a direct partial wave of a total field in a heterogeneous medium) for the independent variable x (the geometric coordinate), use is made of the modification of one of the asymptotic methods in nonlinear oscillation theory. There is still no method developed for finding the relationship between the function of the parameters of the medium and the function of the total field which would have an application general enough to determine the function of the total field with any accuracy at an arbitrary dependence of the function of the medium parameters. The asymptotic procedure presented in the present article for solving the problem of wave propagation makes it possible, on the basis of a selected auxiliary function, to determine simultaneously the two functions discussed with a

Card 1/2

L 34094-66

ACC NR: AP6009053

prescribed accuracy. At the same time, the method proposed makes it possible to investigate the case of nonpropagating waves when the valid solution is not an oscillating one, but a solution which proceeds similar to real exponentials of a solution which describes bound states belonging to the discrete spectrum. Thus, confirmation is provided for the hypothesis proposed by E. Ch. Titchmarsh (Razlozheniye po sobstvennykh funktsiyam. Izd. inostr. lit., 1961, vol. 2) on the possibility of the presence of a transition between the properties of the function of the discrete spectrum and the properties of quasistationary states. The method was also used to obtain solutions for the problem of wave propagation in a heterogeneous medium in more complex cases, including the periodic dependence of the parameter on the coordinate; the solution, however, is not given in the present paper for lack of space. Orig. art. has: 9 figures and 32 formulas.

TITLE: Ultrahigh-frequency Refractometer Based on Surface-wave Lines

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No. 1,  
pp. 116 - 120

TEXT: The device is designed for the measurement of the amplitude and phase of the refraction coefficient of a sample which is situated in the narrow beam of an axial radiating antenna. It is based on the surface-wave devices (Ref. 10) and follows the principle of the Michelson refractometer (Fig. 1). The operation of the system is as follows: a signal from the generator 1 propagates along a surface-wave line and is radiated towards the sample 4; a portion of the signal is transmitted into a standard-signal section 1 - 2 - 11. The portion 3 of the main section is in the form of a dielectric rod radiating antenna, while 5 is a receiving antenna which captures some of the signal transmitted through the sample. Analogously, the portion 11 of the control section

Card 1/5

20698

S/120/61/000/001/036/062

Ultrahigh-frequency ....

E192/E382

is a rod dielectric radiating antenna and 8 is a receiving antenna which receives the signal passing through the standard 9. The signals transmitted through the sample and the standard are applied to a balancing device 6 (through the receiving antennae 5 and 8), which is applied to a null indicator 7. The surface-wave lines in the instrument are in the form of dielectric waveguides, these being polystyrol rods having a cross-section of  $0.31 \times 0.62 \lambda$ . A fine metal grid made of filaments having a diameter of  $6.1 \times 10^{-4} \lambda$  and a winding pitch of  $3.9 \times 10^{-3} \lambda$  is used as the standard. The refraction coefficient of the sample is measured by a successive adjustment of the amplitude and phase of the signal passing through the standard 9 until it is fully compensated by the signal which passes through the measured sample 4. The full compensation is shown by the null indicator 7. The modulus of the refraction index of the sample, at full compensation, is equal to the modulus of the refraction index of the standard, which can be

Card 2/5

20698

S/120/61/000/001/036/062  
E192/E382

Ultrahigh-frequency ....

determined from an experimental graph showing  $T = f(\alpha)$ , where  $\alpha$  is the angle of inclination of the standard refraction grating relative to the orientation of the electric field of the wave. The phase of the refraction index is practically constant when the inclination angle of the grating is changed and the results of the measurement are therefore unambiguous. The phase of the sample is determined from the readings of two scales of the phase shifter, which is situated in the standard-signal section; the position of this phase-shifter is such that it corresponds to the full compensation of the main and the standard signals, as observed on the null indicator. The coarse phase control  $\Phi_T$  of the standard signal is effected by changing the length of the path traversed by the surface wave of the standard signal. The fine adjustment of the phase of the standard signal  $\Phi_T$  is done by means of an electrical vernier consisting of a dielectric waveguide which can be displaced along the axis 8 - 11 by means of a micrometer screw 12. The amplitudes of the standard and the measured signals can also be compared by means of a

controlled balancing device; the standard refraction grating is then not necessary. A refractometer based on this principle is briefly described. There are 7 figures and 16 references: 12 Soviet and 4 non-Soviet.

"The Prevention of Transfusion Hepatitis."

Budapest, Orvosi Hetilap, Vol 104, No 17, 28 Apr 63, pages 780-782.

Abstract: [Authors' Hungarian summary] As a preventive measure against transfusion hepatitis, 182 premature infants were given 8ml/kg gamma globulin during the first transfusion. As controls, 205 premature infants receiving transfusions, and 204 babies receiving various injection treatments but no transfusion, were observed. Hepatitis developed in one case among the group receiving g. gl. and in 15 cases among the group receiving general transfusion. The third group showed no hepatitis. Theoretical explanation for the strong preventive effect of g.gl.is difficult. Further studies are conducted to determine the smallest dose of g.gl. necessary for the preventive effect. 1 Western, 1 Hungarian reference.

Abstract: [Authors' Hungarian summary] Years of experiments were conducted to produce a vaccine for active immunization against hepatitis. The vaccine was to contain the hepatitis virus in weakened enough form so as not to produce the disease in children if administered in quantities (0.01 ml) which would be hepatitogen if native hepatitis serum were used. This was achieved when chemically weakened hepatitis virus was mixed to normal gamma globulin. Of the 122 children vaccinated, none was infected from the vaccine. Without infection, the fact that the virus was actually living could not be proven although previous experiments led to the conclusion. 3 Western, 3 Hungarian references.
